

Domain Description of the Alcohol Database

Artur Salek - 6790615 & Marvin van der Meer - nr

March 5, 2020

For this project we'll make a database describing the drinks and their consumers of cafe 't Neutje. This system will contain the customers, employees, the drinks and a order tab. We'll also keep track of the following aspects:

- Each customer will have a name, address, age and customer ID. We'll use this to keep track of the different customers that order drinks at the cafe.
- Each employee will have a name, pay and employee ID. This'll be used to keep track of when employees serve drinks.
- Each drink will have a name, type, price, alcohol percentage, volume and drink ID. This will keep track of the drinks the cafe has to offer. There will be two different drinks we'll keep track of. The beers and the strong drinks.
- The order tab will contain a timestamp, a customer ID, an employee ID, a drink ID and the amount ordered. This is used to keep track of what the customer ordered and to deduce different habits of the customers.
