'T Neutje, our database, has stock and employee's. The stock contains all drinks available. Employees are a foreign key of People which also contains Customers. Employees all have an ID and a payroll. They also have a contract which is a Foreign Key, which consists of the function, employee ID, first work date and last work date.

Customers all possess a name, address, age and customer ID. This customer ID will be linked to and order together with the drink ID of the drinks ordered, a timestamp and the Employee ID as a Foreign Key. Because of the timestamp and the employee ID, no two orders are able to be the same, as an employee can not take up two orders at the same time.

Drinks can be both Strong or Beer and are both primary keys. They also possess different ID's and characteristics such as Price, Volume and alcohol percentage. Both Strong and Beer possess different primary keys. Strong contains the Type and Beer contains both the type and IBU.
